

# Atmospheric Scientist

written by Saarani Vengadesen | 04/07/2021

An atmospheric scientist studies the [weather](#) and [climate change](#). They are not just weather forecasters. If the weather forecaster predicts the next season, an atmospheric scientist will analyse the pattern and build a map on the overall picture of what it looks like. They look into the dynamics of the weather system.

Being an atmospheric scientist could be adventurous because their workplace is not limited to the lab. Still, they travel often to collect data and watch actual weather conditions from the ground or the aircraft.

Usually, atmospheric scientists work with professionals from other fields to solve environmental, transportation, energy, and agriculture problems.
