

Environmental Engineer

written by admin | 09/02/2021

Environmental issues such as [global warming](#), the [greenhouse effect](#) and pollution are soaring. Environmental engineer is an emerging career in this scenario. They need to discover innovative solutions to environmental problems.

What do environmental engineers do?

- Collect data and analyse how [humans impact the environment](#) to improve recycling, public health, pollution and waste disposal.
- Conduct [hazardous waste](#) management studies.
- Design [municipal water supply](#) and [industrial wastewater treatment](#) systems
- Research the environmental impact of proposed construction projects.

They must be good team players who can work with others to achieve a common goal. They usually work with engineers and scientists (who design systems) and technicians (who implement the design).
