The Cunning Tactics of the Geography Cone Snail

written by Saarani Vengadesen | 23/08/2021

The geography cone (*Conus geographus*) is a tropical sea snail that hunts fish. When a prey swims past, it will release a cloud of specialised <u>insulin</u> that induces a plunge in blood sugar level. The fish then experiences <u>hypoglycaemic shock</u> and is left sluggish, leading to easy capture. Other cone snail species can also fire a harpoon-like <u>proboscis</u>. This has lead to at least 30 human deaths while trying to collect their exquisite shells.
