

The Rhinoceros Beetle

written by Saarani Vengadesen | 25/11/2022

Over 300 species of [*Dynastinae*](#) or rhinoceros beetle are known to exist. They are well known for their unique shapes and large sizes. Some species grow to over 12 centimetres long, but most are about five centimetres long. The males have elongated [mandibles](#) used to wrestle rival males for space or mates. Females have regular jaws.
