

[The Toothsome Wonders of Lobsters and Friends](#)

written by Saarani Vengadesen | 10/05/2021

[Lobsters](#) have their teeth in their stomach. They chew food in their stomach, placed near their mouth between three grinding surfaces that look like [molar](#) teeth called the "[gastric mill](#)". Gastric mill could be found in [crabs](#), [crayfish](#), [krill](#) and [barnacles](#).
