

Were chickens domesticated as a source of food ?

written by Saarani Vengadesen | 25/11/2022

Chickens are a popular source of animal protein around the world. The male chicken is called a rooster. The rooster (*Gallus gallus domesticus*) descended primarily from the Red Junglefowl (*Gallus gallus*). Today, these domesticated subspecies are reared primarily as a source of food for their meat and eggs. Interestingly, when humans first domesticated chickens, they were not intended for their meat and eggs but for the sport of [cockfighting](#).
